

## Sensoterra system

The Sensoterra system consists of probes, a gateway and the stand-alone cloud-system “SoilWare”. Varying probe lengths (15, 30, 60 and 90 centimeters), allow measurement at different soil depths directly at the root of the plant.

Soil moisture data is sent to the cloud through a solar-powered gateway allowing the greenhouse owner to access soil moisture data of different parts of the greenhouse per day, week or even year through PC, smartphone or tablet. Fully automated notifications are sent if the condition of the plant is below a certain threshold enabling timely action.

### Sensoterra probe

- Low-cost
- Plug-and-play
- Wireless
- Lifetime of 20+ years
- Compatible with all soil types
- Wireless range up to 1.5 km
- Measure at different soil depths

## landscaping

## Sensoterra Intelligence

- Manage your locations in an easy to use dashboard
- Display of soil moisture data over time, per probe
- Access your data on laptop, tablet or even in the field on your mobile phone
- Data securely stored in online database
- Receive suggested actions through push notifications or email based on data findings
- Compatible with iPhone or Android, available for download in the App store or Play store.
